## Government 10: Quantitative Political Analysis

Sean Westwood

# Measurement and Sampling

A **hypothesis** is a statement about a possible relationship

A **hypothesis** is a statement about a possible relationship

"Strong economic performance causes more support for democracy"

A **hypothesis** is a statement about a possible relationship

"Strong economic performance causes more support for democracy"

In order to test a hypothesis, we must move from concepts to measurement

A **hypothesis** is a statement about a possible relationship

"Strong economic performance causes more support for democracy"

In order to test a hypothesis, we must move from concepts to measurement

Concept	Measurement
Economic Performance	- Average household income
	- Unemployment rate
Support for Democracy	- Electoral participation rates
	- Survey responses

Most measurements will be imperfect proxies of a concept.

Most measurements will be imperfect proxies of a concept.

We can think of this as basic measurement error

Most measurements will be imperfect proxies of a concept.

We can think of this as basic measurement error

When evaluating measurements, we should think about:

Most measurements will be imperfect proxies of a concept.

We can think of this as basic measurement error

When evaluating measurements, we should think about:

Validity:

Most measurements will be imperfect proxies of a concept.

We can think of this as basic measurement error

When evaluating measurements, we should think about:

Validity:

▶ The concept measures what it is supposed to measure

Most measurements will be imperfect proxies of a concept.

We can think of this as basic measurement error

When evaluating measurements, we should think about:

Validity:

▶ The concept measures what it is supposed to measure

Reliability:

Most measurements will be imperfect proxies of a concept.

We can think of this as basic **measurement error** 

When evaluating measurements, we should think about:

#### Validity:

▶ The concept measures what it is supposed to measure

#### Reliability:

▶ The same result is found if the measurement is repeated (by someone else)

Most measurements will be imperfect proxies of a concept.

We can think of this as basic **measurement error** 

When evaluating measurements, we should think about:

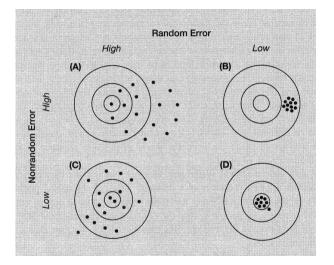

#### Validity:

▶ The concept measures what it is supposed to measure

#### Reliability:

▶ The same result is found if the measurement is repeated (by someone else)

#### Measurement and Error

Some concepts are easier to measure than others

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Wealth: Annual Income

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Wealth: Annual Income

Support for Democracy

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Wealth: Annual Income

Support for Democracy

Support for Immigration

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Wealth: Annual Income

Support for Democracy

Support for Immigration

How do we measure most of these things?

Some concepts are easier to measure than others

Easily Validated < to > Tough to Validate

Age: Date of Birth

Wealth: Annual Income

Support for Democracy

Support for Immigration

How do we measure most of these things? Surveys!

# Survey sampling

Reminder: Learning about a fairly large population by interviewing a small fraction of it.

## Survey sampling

Reminder: Learning about a fairly large population by interviewing a small fraction of it.

Assuming the subset is randomly selected

### Survey sampling

Reminder: Learning about a fairly large population by interviewing a small fraction of it.

- Assuming the subset is randomly selected
- Assuming the subset is representative

## How do we actually run a survey?

Two common methods:

## How do we actually run a survey?

Two common methods:

Probability sampling: every unit of a target population has a known AND non-zero probability of being selected

## How do we actually run a survey?

#### Two common methods:

- Probability sampling: every unit of a target population has a known AND non-zero probability of being selected
- Simple random sampling (SRS): selects a pre-determined number of respondents from a target population with each potential respondent having an equal chance of being selected

How similar is the sample to the 'real-world?'

How similar is the sample to the 'real-world?'

If we repeat the sampling procedure many times, the features of each resulting sample would not be exactly the same as those of the population, but on average (across all the samples) would be identical.

How similar is the sample to the 'real-world?'

If we repeat the sampling procedure many times, the features of each resulting sample would not be exactly the same as those of the population, but on average (across all the samples) would be identical.

We infer population characteristics using those of a representative sample obtained through probability sampling procedures.

How similar is the sample to the 'real-world?'

If we repeat the sampling procedure many times, the features of each resulting sample would not be exactly the same as those of the population, but on average (across all the samples) would be identical.

We infer population characteristics using those of a representative sample obtained through probability sampling procedures.

Candidate support

- Health

How similar is the sample to the 'real-world?'

If we repeat the sampling procedure many times, the features of each resulting sample would not be exactly the same as those of the population, but on average (across all the samples) would be identical.

We infer population characteristics using those of a representative sample obtained through probability sampling procedures.

- Candidate support
- Health
- TV and movie preferences

Things that can go wrong:

Things that can go wrong:

▶ Unit non-response: the failure to reach selected units

Things that can go wrong:

- Unit non-response: the failure to reach selected units
- ▶ *Item non-response*: respondents refuse to answer certain survey questions.

#### Things that can go wrong:

- Unit non-response: the failure to reach selected units
- ltem non-response: respondents refuse to answer certain survey questions.
- Social desirability bias: the problem where respondents choose an answer that is seen as socially desirable regardless of what their truthful answer is
